inventions described in U.S. Patent No. 5,729,554. The improvement comprises a method for determining defects in the functional behavior of a circuit, the functional behavior of the circuit including a plurality of states and a plurality of transitions between the states, the states including a current state, a plurality of next states reachable from the current state, and a reset state, wherein a circuit simulation transitions the current state to first and second next states, whereby the transition from the current state to the second next state is performed automatically after the transition to the first next state without entering a reset state. This patentable distinction is included in each of the independent claims, nos. 11, 16, 27, 29-31, 33, 42, 44, 48-53, 57, 62, 64, and 69. The art of record, either individually or in combination, fails to teach, suggest, or render obvious the useful, concrete and tangible < method for determining defects in the functional behavior of a circuit > having the corresponding structure which is disclosed in the specification and equivalents thereof (at least at <page 12, line 3 through page 38, line 22, and Figures 1A-4>). In view of the foregoing, the claims of the present application are found to be patentable over the prior art.
